1. Introduction

The adoption of Artificial Intelligence and data analytics in the education industry has resulted in new frontiers opening up in optimizing student monitoring and management of academic performance [1][2]. However, despite these advances, it has been observed that undergraduate students still resort to manual and ad hoc methods such as writing down in personal notebooks or basic spreadsheets to check their test performance over several semesters when multiple exams are held [3].

The issue tackled in the proposed project lies in the realm of undergraduate performance management. It has been observed that the students do not have a centralized and smart platform that integrates the performance results and generates insights into academic performance. The related literature in the realm of educational data mining has suggested that the student's performance cannot effectively be analyzed in the absence of a similar platform [4].

The solution to this problem is necessary because of its immediate linkage with learning success and confidence. It has been proved that using AI to detect potential learning issues in students and make forecasts about their academic performance contributes greatly to better learning and academic planning outcomes [5]. But hardly any system works as a student-focused mobile service that students can utilize on their own.

In order to fill the gap, the authors propose the idea of the development of an AI-enabled personal exam results predictor mobile app. The approach involves the implementation of AI algorithms that enable the prediction of results for forthcoming exams by analyzing the previous results. This study aims to incorporate performance analysis, learning schedule, calendar, AI chat support, and past papers. However, the basis of similar AI-enabled learning support ideas has been discussed in previous research works, but the implementation on a combined mobile application basis has been limited [6][7]. This discussion includes the background, need, goals, idea, and theoretical basis that can be utilized for the development of the system.

2. Background and Motivation

Undergraduate degree programs typically span for several semesters with a variety of modules and modes of assessments and grades. The student is expected to be able to track their own performance and plan future academic activities on their own. However, the existing systems for academic information are mainly driven by the dissemination of results and not the monitoring of performances for academic advice [\[3\]\[8\]](#).

By personal observation and interaction with other undergraduate students, some common issues have been identified. Most of these undergraduate students do not keep track of their exam grades. Additionally, research studies have shown that undergraduate students do not realize changes in cumulative GPAs, poor performance in particular modules, and the impact of missed assessments until towards the end of their study programs [\[6\]\[7\]](#).

The lack of such a system in the learning institution creates proactive yet reactive students. Research studies show that machine learning predictive systems and AI-based advising systems play a crucial part in early academically-related interventions and enhanced student engagement [\[8\]\[9\]\[10\]](#). These systems tend to be institutionally-aligned or limited systems that are not designed for the sole use of the students.

This project is motivated by the need for an intelligent, accessible, personalized tool to enable undergraduate students to manage their academic performance. In view of the identified gaps, this project will integrate academic result management, performance analytics, future result prediction, and academic planning within one mobile application. The capability of independently designing, implementing, and evaluating the proposed solution is drawn from the author's academic background in computing and familiarity with the techniques of data analysis and machine learning [\[11\]](#).

3. Problem Statement

The primary issue addressed in this project is the lack of an intelligent, student-centric system that enables undergraduate students to track, analyze, and predict their academic performance across multiple semesters. Existing approaches to academic result management are fragmented, reactive, and largely limited to static result viewing, offering little support for performance analysis or future academic planning. Due to this shortcoming, the following challenges face the students:

- Lack of awareness of weak modules and recurring low performance across semesters.
- Inability to clearly understand longitudinal GPA progression, decline, or improvement over time.
- Difficulty identifying the academic impact of missed assessments and medical submissions.
- Absence of predictive insight into future examination outcomes, leading to uncertainty and poor preparation strategies.
- Limited support for proactive planning of re-sits, future modules, and assessment timelines.
- Dependence on manual methods or fragmented tools, which increases the likelihood of errors and inconsistent tracking.
- Increased academic stress and anxiety due to uncertainty regarding academic standing and future performance.
- Lack of personalized academic guidance that aligns performance data with actionable study plans.

Without a centralized and intelligent academic performance management platform, students are unable to make timely, data-driven decisions to improve their learning outcomes. This gap highlights the need for an integrated AI-based solution that supports continuous performance monitoring, predictive analysis, and personalized academic planning for independent undergraduate students.

4. Aim & Objectives

- **Aim**

- To design, develop, and evaluate an AI-based mobile application that can predict the performance of undergraduate students in the future using past performance data and supports proactive academic planning.

- **Objectives**

- For carrying out an analysis on past academic performance records of undergraduate students.
- To design and implement machine learning models capable of predicting future examination outcomes based on past grades.
- To develop a mobile application that allows students to upload their academic results in PDF format or manually enter their academic results.
- To work on performance analytics to identify weak modules, GPAs, and indicators of academic risk.
- To implement the AI chatbot function that offers relevant academic support informed by performance data.
- To generate personalized study plans and academic recommendations aligned with predicted outcomes.
- In order to incorporate the academic calendar functionality to help plan for future examinations and academic events.
- Aspects relating to the effectiveness and usability of the proposed system for independent undergraduate use.

5. Proposed Solution

- **Solution Background**

- In response to the challenges associated with undergraduate academic performance tracking, result management, and uncertainty regarding future examination outcomes, this project proposes the development of an AI-Based Personal Exam Results Predictor Mobile Application. The proposed solution aims to transform how undergraduate students manage their academic records by providing an intelligent, centralized, and student-centric platform for performance monitoring and academic planning.
- The current academic systems are mostly used for result distribution and administration, and they do not provide much analytical assistance to the students. The literature on education data mining emphasizes the need to empower the students with tools that support self-monitoring, early risk identification, and proactive learning strategies [6]. However, integrated solutions that combine result management, performance analysis, and prediction within a mobile environment remain limited.
- The proposed system utilizes machine learning algorithms in the analysis of historical academic grades and GPAs to enable the prediction of performance in future examination sessions. Unlike many existing systems that require structured datasets, this application supports PDF-based result uploads and manual data entry, increasing usability and accessibility for undergraduate students. In addition, the integration of an AI chatbot enables real-time academic guidance, clarification of performance insights, and personalized study recommendations, consistent with recent advancements in AI-driven educational support systems [8].
- By integrating performance analysis, predictive models, academic calendar management, personal study planning, all in one single mobile app, the proposed system offers a one-stop solution for academic self-management.

Figure 1.1 [Solution Background](#)

- **Development Methodology**

- The development of the proposed mobile application will follow the Agile Software Development methodology, which emphasizes iterative development, adaptability, and continuous evaluation. Agile is particularly suitable for individual academic projects, as it allows incremental implementation of features while accommodating refinements based on testing and feedback.
- The Scrum framework will be adopted as the Agile approach for this project. Development will be organized into short sprints, each focusing on specific functional components such as result input and processing, performance analytics, prediction model integration, calendar management, AI chatbot functionality, and study plan generation. Each sprint will include planning, design, implementation, testing, and documentation activities, ensuring systematic progress throughout the Software Development Life Cycle (SDLC) [11].
- Through the combined adoption of Agile development and the Scrum framework, a robust, user-friendly, and scalable mobile application is aimed to be developed, ensuring continuous improvement of system functionality, early identification of technical issues, and adaptability to evolving student needs and feedback throughout the project lifecycle.

Figure 1.2 [Agile Development Methodology](#)

- **Inputs**

- Academic Result Data: Examination results uploaded in PDF format or entered manually by students.
- User Profile Data: Degree programme, academic year, semester details, and module information.
- Historical Performance Data: Past grades and GPA records used for trend analysis and prediction.
- Academic Calendar Data: Examination schedules, re-sit dates, and personal academic reminders.

- **Processes**

1. Data Ingestion and Preprocessing: Academic results from PDFs and manual inputs will be extracted, validated, and structured for analysis. Data preprocessing techniques will be applied to handle inconsistencies and missing values [\[9\]](#).
2. Performance Analysis: Historical academic data will be analyzed to identify GPA trends, weak modules, repeated low-performance patterns, and potential academic risk indicators [\[6\]](#)[\[7\]](#).
3. Exam Result Prediction: Machine learning models will be applied to predict future examination outcomes based on historical performance data, enabling students to anticipate results and prepare proactively [\[13\]](#).
4. Study Plan Generation: Personalized study plans will be generated by aligning predicted performance outcomes, weak subject areas, and academic timelines [\[10\]](#).
5. AI Chatbot Interaction: An AI chatbot will provide real-time academic assistance, performance explanations, study guidance, and system navigation support, improving accessibility and engagement [\[8\]](#).
6. Calendar Management: Academic events such as examinations, re-sits, and study milestones will be managed through an integrated calendar with reminders and notifications.

- **Outputs**

- Academic performance analytics and GPA trend reports: Visual and statistical representations of GPA trends, semester-wise performance comparisons, identification of weak modules, and academic risk indicators.
- Future GPA Projection: An estimated future GPA generated using machine learning models based on historical grades and observed performance patterns. The projection will indicate the likely GPA outcome if the student continues studying with similar performance levels, accompanied by confidence indicators and explanatory notes.
- Personalized Study Plans and Recommendations: Data-driven study plans tailored to individual performance profiles, highlighting priority subjects, and recommended study plans.
- Academic Calendar Alerts and Reminders: Automated notifications for examinations, re-sits, coursework deadlines, and planned study milestones to support effective time management.
- AI Chatbot-Based Academic Guidance: Real-time responses providing explanations of performance analytics, clarification of predictions, study advice, and system navigation assistance, enhancing user engagement and accessibility.

- **Users of the System**

- Undergraduate students across all academic years and disciplines.
- Individual students managing their academic performance independently.

Activity	Description	Estimated Duration
Planning the Project	• Topic finalization • Supervisor approval • Scope definition • Project plan preparation	4 weeks
Analyzing the Project	• Literature review • Requirement analysis • Problem refinement • Feasibility analysis	6 weeks
Designing the Project	• System architecture design • Database design • UI/UX wireframes • GPA logic design	6 weeks
Developing the Project	• Mobile application development • GPA calculation • AI model development • Chatbot integration • Calendar and study plan modules	18 weeks
Testing the Project	• Functional testing • Prediction accuracy testing • Usability testing • Bug fixing	6 weeks
Deployment and Maintenance of the Project	• Final system deployment • Performance optimization • Minor improvements	4 weeks
Complete Documentation	• Proposal updates • Final report writing • Formatting • Proofreading	2 weeks
Total Effort	-	46 weeks
Approximately	-	10.5 months

Table 2.1: Time Estimated Table

- **Feasibility of Implementation**

1. Technical Feasibility

- The proposed system can be implemented using widely available mobile development tools, machine learning libraries, and backend services. Required technical skills mobile application development, data analysis, and basic machine learning are achievable within the scope of an individual undergraduate project [\[9\]\[11\]](#).

2. Operational Feasibility

- The system is designed to be user-friendly and intuitive, allowing undergraduate students to integrate it into their existing academic routines with minimal effort.

3. Scheduling Feasibility

- A structured and realistic development timeline has been defined based on the Waterfall methodology, with clearly sequenced phases including requirements analysis, system design, implementation, testing, and deployment. This phased approach ensures that all project activities are completed systematically within the allocated project duration.

4. Economic Feasibility

- The project minimizes cost by utilizing open-source frameworks, free development tools, and cloud-based services, making it economically viable for an individual academic project.

- **Resource Availability**

1. Hardware Resources

- Personal computer for development and testing
- Android device or emulator

2. Software Resources

- Android Studio IDE
- Machine learning libraries (e.g., TensorFlow Lite, Scikit-learn)
- Firebase for backend and authentication
- PDF processing libraries

3. Human Resources

- Single developer (individual project)

4. Data Resources

- User-provided academic result data
- Optional public academic datasets for validation

5. Security Resources

- Secure authentication and access control
- Encrypted data storage and secure communication mechanisms

6. Literature Review

Academic Performance Analysis in Higher Education

- Academic performance analysis has been widely studied in higher education as a means of understanding student progression and identifying factors that influence learning outcomes. Previous research indicates that students' historical grades and cumulative GPA provide a reliable foundation for evaluating academic trends over time [1][2]. Longitudinal analysis of academic results enables the identification of performance decline, improvement patterns, and persistent weak subject areas, which are often overlooked when results are viewed on a semester-by-semester basis [3].
- Several studies emphasize that students frequently lack awareness of how individual module results contribute to overall GPA changes, leading to delayed academic intervention [4][7]. These findings highlight the importance of systems that support continuous academic self-monitoring rather than passive result viewing.

Machine Learning Techniques for Academic Performance and GPA Prediction

- Numerous studies have demonstrated the effectiveness of machine learning algorithms in predicting student academic performance. Techniques such as linear regression, decision trees, random forests, support vector machines, and neural networks have been successfully applied to forecast grades, GPA outcomes, and academic risk levels based on historical academic data [12].
- Research by Cortez and Silva emphasizes that GPA-based prediction models can provide meaningful insights when historical performance trends are used as primary predictors [9]. Similarly, other studies confirm that predictive models focusing on past grades are particularly suitable for continuous performance forecasting, especially when the prediction assumption is explicitly defined as “future performance under similar study behavior” [8]. These findings directly support the core objective of the proposed system, which aims to predict future GPA based on past academic trends.

Longitudinal GPA Analysis and Academic Risk Identification

- Longitudinal analysis of academic performance has been identified as a critical factor in understanding student progression over time. Studies indicate that many students fail to recognize gradual GPA decline or repeated weak performance in specific modules until late stages of their degree programme [7]. GPA trend visualization and module-level performance analysis have been shown to improve student awareness and encourage timely corrective actions.
- Academic risk identification models further demonstrate that analyzing semester-wise GPA progression enables early detection of students who may require academic intervention [6][10]. However, existing implementations are often institution-driven and inaccessible to students as personal tools, creating a gap that the proposed project seeks to address.

AI-Based Personalized Study Planning and Recommendation Systems

- Personalized recommendation systems have been widely researched in educational contexts to support adaptive learning and targeted study planning. Studies show that aligning study recommendations with performance data significantly improves learning efficiency and academic outcomes [11][13]. Studies show that students benefit when study plans are aligned with subjects that have the highest impact on GPA improvement rather than evenly distributing effort across all modules [14].
- Despite their effectiveness, many recommendation systems are embedded within Learning Management Systems (LMS) and lack integration with predictive GPA analytics. The proposed system addresses this limitation by directly linking study plans to GPA-based predictions and module-level performance analysis.

AI Chatbots in Educational Support Systems

- The integration of AI chatbots in education has emerged as an effective approach for improving student engagement, accessibility, and real-time academic support. Research indicates that conversational agents can successfully assist students by answering academic queries, explaining performance metrics, and providing personalized guidance [15].

- AI chatbots have also been shown to improve interpretability of complex analytics by translating predictive insights into understandable explanations for students. This capability is particularly important in GPA prediction systems, where transparency and user understanding influence trust and usability. These findings justify the inclusion of an AI chatbot component in the proposed application.

Student-Centric Academic Support Systems

- Recent literature highlights the need for student-centric academic support tools that operate independently of university administrative systems. Studies report that institutional portals are primarily designed for result publication and lack features for personal performance tracking, prediction, and academic planning [\[4\]\[16\]](#). Students often resort to manual methods such as spreadsheets or informal tracking, which limits accuracy and consistency.
- Mobile-based academic support systems have been identified as particularly effective due to their accessibility and continuous availability [\[17\]](#). However, research also notes that many existing applications focus on isolated features such as reminders or note management, without incorporating GPA analysis or predictive capabilities.

Conversational Support for Academic Understanding

- Several recent studies explore the use of conversational systems to assist students in understanding academic information. These systems have been shown to improve clarity when explaining performance metrics, academic progress, and study recommendations [\[18\]](#). Importantly, literature emphasizes that such systems should support explanation and guidance rather than decision-making autonomy, ensuring that students retain control over academic choices.
- This supports the inclusion of a conversational assistance component in the proposed system to explain GPA calculations, prediction assumptions, and performance insights in a clear and interpretable manner.

- **Research Gap**

- Although extensive research exists on GPA analysis, academic performance prediction, personalized study planning, and student support systems, these areas are largely addressed in isolation. Existing solutions are predominantly institution-centric, web-based, or limited to single-function tools such as grade prediction or analytics dashboards [9][16].
- There is a clear lack of student-centric mobile applications that integrate PDF-based academic result input, longitudinal GPA analysis, future GPA prediction under consistent performance assumptions, personalized study planning, academic calendar management, and conversational academic support within a single system. Addressing this gap forms the foundation of the proposed project.
